Merge Sort

Write a Python program to sort a list of elements using the merge sort algorithm.

For example:

| Input | Result |
|------------|-----------|
| 5 65438 | 3 4 5 6 8 |

Program:

Output:

| | Input | Expected | Got |
|----------|---------------------------------|----------------------------|------------------------|
| * | 5 6 5 4 3 8 | 3 4 5 6 8 | 3 4 5 6 8 |
| ~ | 9 14 46 43 27 57 41 45 21 70 | 14 21 27 41 43 45 46 57 70 | 14 21 27 41 43 45 46 5 |
| ~ | 4 86 43 23 49 | 23 43 49 86 | 23 43 49 86 |

Bubble Sort

Given an list of integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:

- 1. <u>List</u>is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted<u>list</u>.
- 3. Last Element: lastElement, the *last* element in the sorted<u>list</u>.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps.

First Element: 1 Last Element: 6

Input Format

The first line contains an integer, n, the size of the <u>list</u>a. The second line contains n, space-separated integers a[i].

Constraints

- · 2<=n<=600
- $1 \le a[i] \le 2x10_6$.

Output Format

You must print the following three lines of output:

- 1. <u>List</u>is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: first Element, the *first* element in the sorted <u>list</u>.
- 3. Last Element: lastElement, the *last* element in the sortedlist.

Sample Input 0

3

123

Sample Output 0

<u>List</u>is sorted in 0 swaps.

First Element: 1 Last Element: 3

For example:

| Input | Result |
|------------|---|
| 3 3 2 1 | List is sorted in 3 swaps. First Element: 1 Last Element: 3 |
| 5 19284 | List is sorted in 4 swaps. First Element: 1 Last Element: 9 |

Program:

```
\label{eq:continuous_series} \begin{split} &\text{defbubble\_sort(arr):}\\ &n = \text{len(arr)} \quad \text{swaps} = \\ &0 \\ & \text{for i in range(n):} \quad \text{for j in range(0, ni-1):}\\ &\text{if arr[j]} > &\text{arr[j + 1]:} \quad \# \text{Swap elements}\\ &\text{arr[j], arr[j + 1]} = &\text{arr[j + 1], arr[j]}\\ &\text{swaps} += 1 \\ &\text{return swaps} \end{split}
```

Input the size of the list n

```
= int(input())
# Input the list of integers arr = list(map(int,
input().split()))

# Perform bubble sort and count the number of swaps
num_swaps = bubble_sort(arr)

# Print the number of swaps
print("List is sorted in", num_swaps, "swaps.")

# Print the first element print("First
Element:", arr[0])

# Print the last element print("Last
Element:", arr[-1])
```

Output:

Ex. No. : 10.3 Date: 4.6.2024

Register No: 231401035 Name: HEMALATHA.K

Peak Element

Given anlist, find peak element in it. A peak element is an element that is greater than its neighbors.

An element a[i] is a peak element if

 $A[i-1] \le A[i] \ge a[i+1]$ for middle elements. $[0 \le i \le n-1]$

 $A[i-1] \le A[i]$ for last element [i=n-1]

A[i]>=A[i+1] for first element [i=0]

Input Format

The first line contains a single integer n, the length of A. The second line contains n space-separated integers, A[i].

Output Format

Print peak numbers separated by space.

Sample Input

5

891026

Sample Output

10 6

For example:

| Input | Result |
|---------------|--------|
| 4 12 3 6 8 | 12 8 |

Program:

```
deffind_peak(arr):
peak_elements = []
                      # Check for the
first element if arr[0] \ge arr[1]:
peak_elements.append(arr[0])
  # Check for middle elements
                                  for
i in range(1, len(arr) - 1):
                               if arr[i
-1] \le arr[i] \ge arr[i+1]:
peak_elements.append(arr[i])
  # Check for the last element
                                  if
arr[-1] >= arr[-2]:
peak_elements.append(arr[-1])
  return peak_elements
# Input the length of the list n
= int(input())
# Input the list of integers arr = list(map(int,
input().split()))
# Find peak elements and print the result
peak_elements = find_peak(arr) print(*peak_elements)
```

Output:

Ex. No. : 10.4 Date: 4.6.2024

Register No: 231401035 Name: HEMALATHA.K

Binary Search

Write a Python program for binary search.

For example:

| Input | Result |
|-------------------|--------|
| 12358 | False |
| 3 5 9 45 42 42 | True |

Program:

a = input().split(",")

b = input() print(b in a)

Output:

Ex. No. : 10.5 Date: 4.6.2024

Register No: 231401035 Name: HEMALATHA.K

Frequency of Elements

To find the frequency of numbers in a list and display in sorted order.

Constraints: 1<=n, arr[i]<=100 Input: 1 68 79 4 90 68 1 4 5

output:

1 2

42

5 1

 $68\ 2$

79 1

90 1

For example:

| Input | Result |
|-------------|-------------------|
| 4 3 5 3 4 5 | |
| | 3 2 4 2 5 2 |

Program:

defcount_frequency(arr):

```
frequency = {}
```

Count the frequency of each number in the list

for num in arr: frequency[num] = frequency.get(num,

0) + 1

```
# Sort the dictionary based on keys sorted_frequency
= sorted(frequency.items())
```

Print the frequency of each number for
num, freq in sorted_frequency:
print(num, freq)

Input the list of numbers arr = list(map(int, input().split()))

Count the frequency and print the result
count_frequency(arr)

Output:

| | Input | Expected | Got | |
|---|-----------------|----------------------------------|----------------------------------|---|
| ~ | 4 3 5 3 4 5 | 3 2 4 2 5 2 | 3 2 4 2 5 2 | ~ |
| ~ | 12 4 4 4 2 3 5 | 2 1 3 1 4 3 5 1 12 1 | 2 1 3 1 4 3 5 1 12 1 | ~ |
| ~ | 5 4 5 4 6 5 7 3 | 3 1 4 2 5 3 6 1 7 1 | 3 1 4 2 5 3 6 1 7 1 | ~ |
